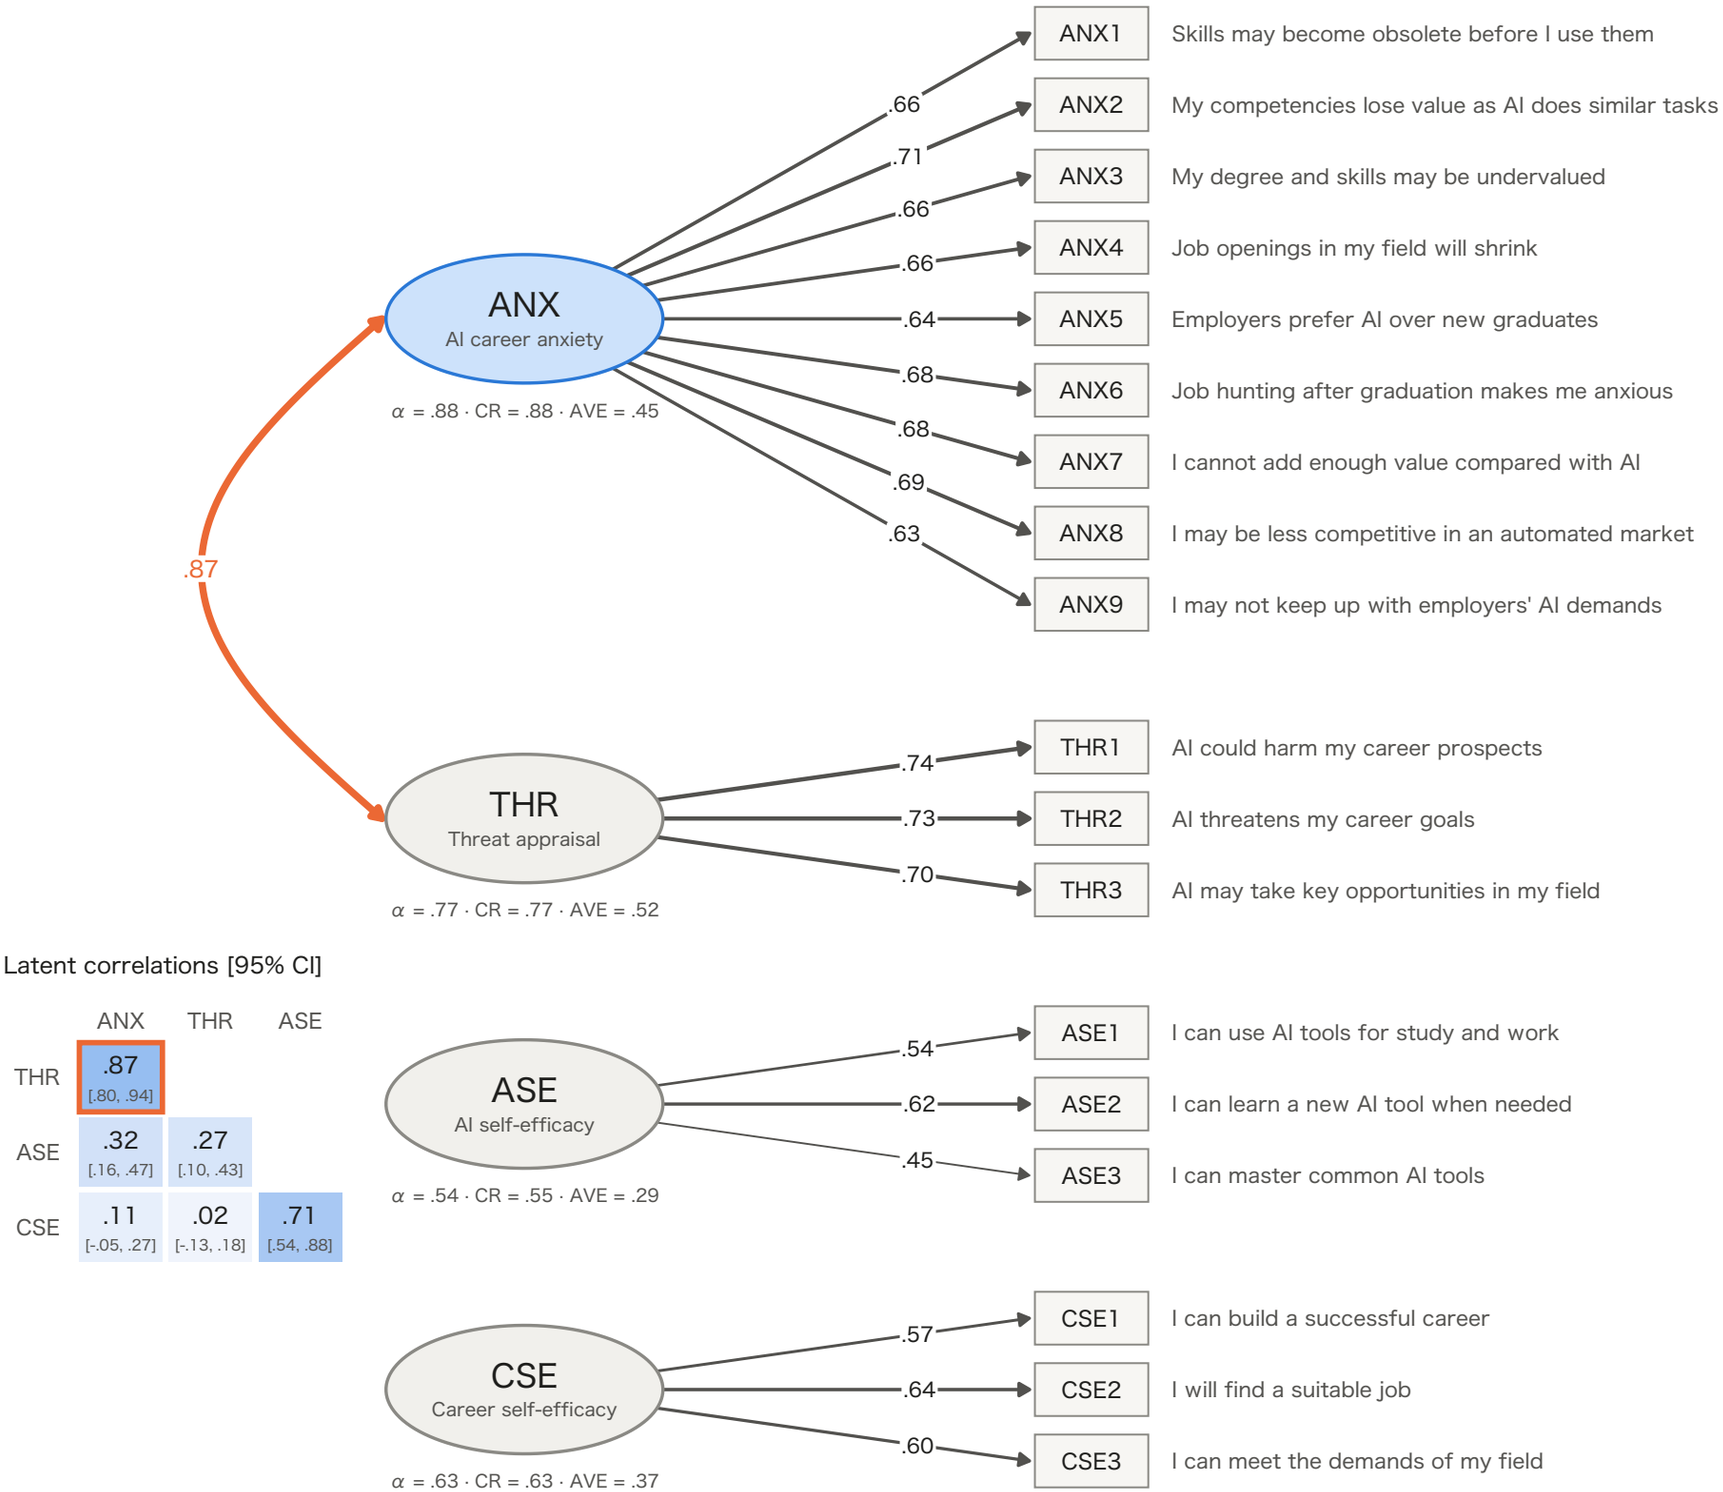
## Measurement model with standardized estimates

Four-factor CFA (MLR). $\chi^2(129) = 182.12$, CFI = .976, TLI = .972, RMSEA = .032, SRMR = .039, N = 464



Latent correlations [95% CI]

| | ANX | THR | ASE |
|---|---|---|---|
| THR | .87 [.80, .94] | | |
| ASE | .32 [.16, .47] | .27 [.10, .43] | |
| CSE | .11 [-.05, .27] | .02 [-.13, .18] | .71 [.54, .88] |

Note. Straight arrows show standardized loadings (all p < .001). All factors were free to correlate (inset, lower left). The orange arc and outlined cell mark the ANX–THR overlap examined in the discriminant validity analysis. Reliability is shown under each factor.
