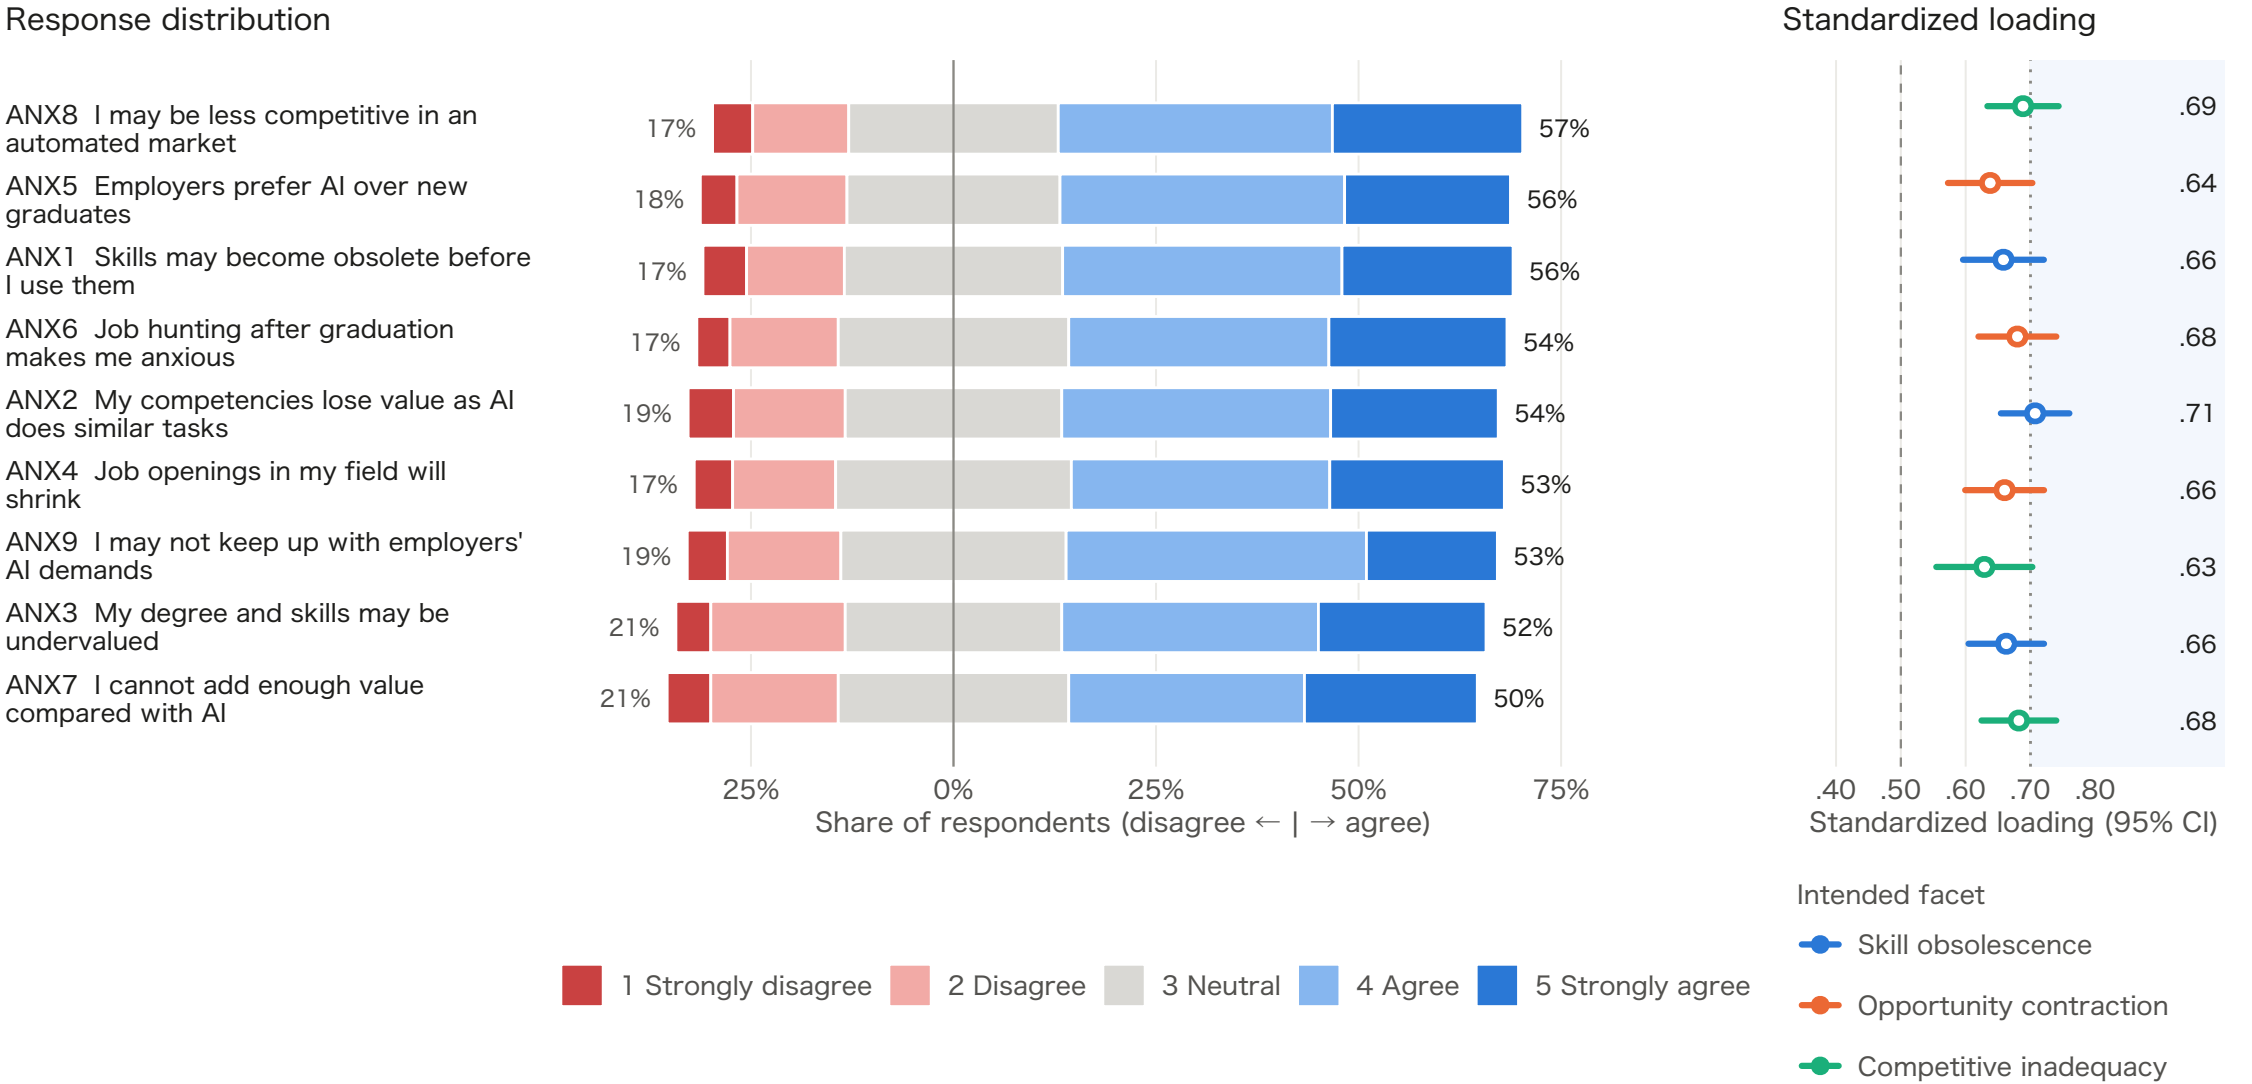
AI career anxiety items: how students responded and how strongly each item loads

Items sorted by agreement. Agreement ranges from 50% to 57% across items, and loadings are similar across the three intended facets, which is consistent with a single underlying dimension.



Note. N = 464. Percentages left and right of each bar are total disagreement (1–2) and agreement (4–5); the neutral share is split at zero.
Loadings are from the four-factor measurement model (Figure 1). Dashed line = .50, dotted line = .70. One-factor model for the 9 items: CFI = .995, RMSEA = .025.
