AI career anxiety across student groups

Overall M = 3.51, SD = 0.79 (dashed line). Scalar invariance holds for each grouping, so these mean comparisons are interpretable.

Note. Violins show the distribution, boxes the median and IQR, dots individual students; orange diamonds and bars are means with 95% CI. Tests are Welch's ANOVA (F) or Welch's t test (t) on the composite score; η^2 and Cohen's d are effect sizes. Year 4 and beyond-year-4 students are combined (n = 10 in the latter). The gender panel excludes 22 respondents reporting another gender or preferring not to say.
